

WEEK – 5

DURATION: 9 February 2026 – 13 February 2026

DAY 1: 9 February 2026

1. TASKS WORKED ON

- ***Double Click Handling in React:*** Learned how to handle double-click events in React and implemented dynamic UI updates using `useState()`.
- ***Input Text Preview:*** Implemented the concept of `useEffect()` through an Input Text Preview task.
- ***Change Background Color:*** Implemented a dynamic background color changer application.
- ***Login Window:*** Started implementing a Login Window system with the planned functionalities.

2. LEARNING AND KNOWLEDGE GAINED

Today, I learned and implemented key React Hooks, including `useState()` and `useEffect()`, to manage component state and handle side effects effectively. I also strengthened my understanding of dynamic rendering and state-driven UI updates, enabling the development of more interactive and responsive React applications.

3. PLAN FOR NEXT WORKING DAY

Complete the remaining tasks and learn additional concepts related to React.

DAY 2: 10 February 2026

1. TASKS WORKED ON

- ***Simple Login Toggle:*** Implemented a Login Toggle system with the specified functionalities.
- ***Timer (Seconds Counter):*** Created a Timer application that starts from 0 and increases every second using React Hooks. Also ensured that the timer stops properly when the component is removed, preventing unnecessary background processes.
- ***Window Width Tracker:*** Implemented a Window Width Tracker that displays the current browser window width and updates automatically whenever the window is resized. This helped me understand event handling and state updates in React.
- ***API Data Fetch (Basic):*** Implemented API data fetching to retrieve and display user information from an external API. Added a loading indicator to improve the user experience while data was being fetched.
- ***Auto Reset Counter:*** Implemented an Auto Reset Counter that continuously increments the counter value at regular intervals. The counter automatically resets to 0 when it reaches 10, helping me understand state management and conditional rendering in React.

2. LEARNING AND KNOWLEDGE GAINED

Today, I strengthened my understanding of React Hooks, particularly `useState()` and `useEffect()`, through practical implementation. I also improved my knowledge of API handling, event listeners, lifecycle management, and dynamic state updates in React applications.

3. PLAN FOR NEXT WORKING DAY

Learn additional advanced concepts related to React.

DAY 3: 11 February 2026

1. TASKS WORKED ON

- ***Showing Input Text Using useRef and useEffect:*** Implemented functionality where the user enters text into an input field and, upon clicking a button, the entered text is displayed dynamically.
- ***Opening File Upload Using useRef:*** Implemented functionality where clicking a custom button opens the file upload dialog using useRef() instead of directly using the default input type="file".
- ***Understanding memo() to Reduce Unnecessary Re-renders:*** Learned and implemented memo() in React to prevent unnecessary re-rendering of components. Created two components where one component was nested inside another and optimized rendering behavior using memo().
- ***Generating Unique IDs Using UUID:*** Implemented functionality to generate unique IDs dynamically using uuid(). When the user clicks the “Generate ID” button, a unique ID is created automatically.

2. LEARNING AND KNOWLEDGE GAINED

Today, I learned and implemented useRef(), memo(), and the uuid package in React. I also gained practical knowledge of component optimization, DOM references, and unique ID generation.

3. PLAN FOR NEXT WORKING DAY

Learn additional concepts related to React.

DAY 4: 12 February 2026

1. TASKS WORKED ON

- ***Input Focus Controller:*** Implemented functionality demonstrating how `useRef()` is used to directly access and control an input element in React.
- ***Login System using React:*** Developed a Login System using React Hooks with automatic input focus, form validation, and basic login functionality. This helped me gain practical experience with `useEffect()` and `useRef()` in React.
- ***UUID Generator:*** Implemented a UUID Generator system where unique IDs are generated dynamically using `uuid()` whenever the user clicks the “Generate ID” button.

2. LEARNING AND KNOWLEDGE GAINED

Today, I strengthened my understanding of React concepts including:

- `useRef()`
- `memo()`
- `uuid()`

I also improved my practical knowledge of input control, focus handling, and component optimization in React applications.

3. PLAN FOR NEXT WORKING DAY

Learn additional advanced concepts related to React.

DAY 5: 13 February 2026

1. TASKS WORKED ON

- ***Trello-like Board Project Development:*** Developed a Trello-like Board application with Todo, Doing, and Done columns, allowing users to add, delete, and manage tasks and cards efficiently. The project also included local storage support, unique ID generation, task completion tracking, and performance optimization using React Hooks and advanced React concepts.

2. LEARNING AND KNOWLEDGE GAINED

Today, I strengthened my understanding of advanced React concepts including:

- useRef()
- memo()
- uuid()
- useEffect() for syncing with Local Storage

I also improved my practical knowledge of state management, reusable components, and performance optimization in React applications.

3. PLAN FOR NEXT WORKING DAY

Learn additional advanced concepts related to React.
